Abstract. We extend a new treatment proposed for two-nucleon (2N) and three-nucleon (3N) bound states to 2N scattering. This technique takes momentum vectors as variables, thus, avoiding partial wave decomposition, and handles spin operators analytically. We apply the general operator structure of a nucleon-nucleon (NN) potential to the NN T-matrix, which becomes a sum of six terms, each term being scalar products of spin operators and momentum vectors multiplied with scalar functions of vector momenta. Inserting this expansions of the NN force and T-matrix into the Lippmann-Schwinger equation allows to remove the spin dependence by taking traces and yields a set of six coupled equations for the scalar functions found in the expansion of the T-matrix.

1 Introduction

In Ref. [1] a new formulation for the 2N and 3N bound states in three dimensions has been proposed. In this technique momentum vectors are taken as variables, avoiding a traditional partial-wave decomposition. In addition spin operators occurring as scalar products of spin and momentum vectors - shortly called spin-momentum operators - are evaluated analytically by means of trace operations. In this approach a NN force is employed using its most general operator structure, i.e. as sum of 6 spin-momentum operators multiplied with scalar functions of momenta. A spin-momentum operator representation is used as well for the 2N and 3N bound states, as in Refs. [2] and [3], respectively.

We extend the technique developed in Ref. [1] to NN scattering. This would be an alternative to other three-dimensional approach formulated in a momentum-helicity basis [4]. In addition we introduce a new set of spin-momentum operators different from the one used in Ref. [1]. We find one of the spin-momentum operators in Ref. [1] violates time reversal and, therefore, has to be multiplied with a time-reversal violating scalar function. Here we prefer to work with operators, which are also invariant with respect to time reversal. The idea is to apply the general operator structure not only to the NN force but also to the NN T-matrix. The goal is then to find the scalar functions in the expansion of the T-matrix into the spin-momentum operators. First, we insert the spin-momentum operators expansions of the NN interaction and T-matrix into the Lippmann-Schwinger equation. Next by analytical evaluation we remove the spin dependence yielding finally a set of coupled equations for the scalar functions of

the T-matrix. Finally we connect the T-matrix to the anti-symmetrized scattering amplitude parameterized by the Wolfenstein parameters.

2 Formulation

2.1 The general operator structure of NN potential

The general operator structure of NN potential reads

$$V^{tm_i}(\mathbf{p}', \mathbf{p}) = \sum_{j=1}^6 v_j^{tm_i}(\mathbf{p}', \mathbf{p}) w_j(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}), \quad (1)$$

with $V^{tm_i}(\mathbf{p}', \mathbf{p})$ being the NN potential projected on the NN total isospin states $|tm_i\rangle$ as

$$V^{tm_i}(\mathbf{p}', \mathbf{p}) = \langle tm_i | V(\mathbf{p}', \mathbf{p}) | tm_i \rangle. \quad (2)$$

The scalar functions $v_j^{tm_i}(\mathbf{p}', \mathbf{p})$ depend only on the vector momenta. the $w_j(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p})$ are a set of spin-momentum operators,

$$\begin{aligned} w_1(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) &= 1 \\ w_2(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) &= \boldsymbol{\sigma}_1 \cdot \boldsymbol{\sigma}_2 \\ w_3(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) &= i (\boldsymbol{\sigma}_1 + \boldsymbol{\sigma}_2) \cdot (\mathbf{p} \times \mathbf{p}') \\ w_4(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) &= \boldsymbol{\sigma}_1 \cdot (\mathbf{p} \times \mathbf{p}') \boldsymbol{\sigma}_2 \cdot (\mathbf{p} \times \mathbf{p}') \\ w_5(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) &= \boldsymbol{\sigma}_1 \cdot (\mathbf{p}' + \mathbf{p}) \boldsymbol{\sigma}_2 \cdot (\mathbf{p}' + \mathbf{p}) \\ w_6(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) &= \boldsymbol{\sigma}_1 \cdot (\mathbf{p}' - \mathbf{p}) \boldsymbol{\sigma}_2 \cdot (\mathbf{p}' - \mathbf{p}), \end{aligned} \quad (3)$$

which is time-reversal invariant. As an example a leading order (LO) chiral NN potential is given as [5]

^a e-mail: imamf@fisika.ui.ac.id

$$\begin{aligned}
 V_{LO}(\mathbf{p}', \mathbf{p}) = & -\frac{1}{(2\pi)^3} \frac{g_A^2}{4F_\pi^2} \frac{w_6(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p})}{(\mathbf{p}' - \mathbf{p})^2 + M_\pi^2} \boldsymbol{\tau}_1 \cdot \boldsymbol{\tau}_2 \\
 & + \frac{C_S}{(2\pi)^3} w_1(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) \\
 & + \frac{C_T}{(2\pi)^3} w_2(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}). \quad (4)
 \end{aligned}$$

2.2 The deuteron

We briefly describe the formulation for the deuteron. The deuteron has total spin 1 and isospin 0. In spin-momentum operator representation the deuteron state is given as [2]

$$\Psi_{m_d}(\mathbf{p}) = \langle \mathbf{p} | \Psi_{m_d} \rangle = \sum_{k=1}^2 \phi_k(p) b_k(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) |1m_d\rangle, \quad (5)$$

where $|1m_d\rangle$ is the total-spin state with magnetic quantum number m_d , $\phi_k(p)$ scalar functions depending on the magnitude of momenta only, and $b_k(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p})$ spin-momentum operators given as

$$\begin{aligned}
 b_1(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) &= 1 \\
 b_2(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) &= \boldsymbol{\sigma}_1 \cdot \mathbf{p} \boldsymbol{\sigma}_2 \cdot \mathbf{p} - \frac{1}{3} p^2. \quad (6)
 \end{aligned}$$

The scalar functions $\phi_k(p)$ are connected to the standard partial-wave projected deuteron s-wave $\psi_0(p)$ and d-wave $\psi_2(p)$ by [2]

$$\begin{aligned}
 \psi_0(p) &= \phi_1(p) \\
 \psi_2(p) &= \frac{4p^2}{3\sqrt{2}} \phi_2(p). \quad (7)
 \end{aligned}$$

Inserting $\Psi_{m_d}(\mathbf{p})$ of Eq. (5) and $V^{m_i}(\mathbf{p}', \mathbf{p})$ of Eq. (1) into the Schrödinger equation for the deuteron in integral form,

$$\Psi_{m_d}(\mathbf{p}) = \frac{1}{E_d - \frac{p^2}{m}} \int d^3 p' V^{00}(\mathbf{p}, \mathbf{p}') \Psi_{m_d}(\mathbf{p}'), \quad (8)$$

yields

$$\begin{aligned}
 & \sum_{k=1}^2 \phi_k(p) b_k(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) |1m_d\rangle \\
 &= \frac{1}{E_d - \frac{p^2}{m}} \int d^3 p' \sum_{j=1}^6 v_j^{00}(\mathbf{p}, \mathbf{p}') w_j(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}, \mathbf{p}') \\
 & \quad \sum_{k'=1}^2 \phi_{k'}(p) b_{k'}(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}') |1m_d\rangle. \quad (9)
 \end{aligned}$$

To remove the spin dependence from Eq. (9) we project Eq. (9) on $\langle 1m_d | b_i(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p})$ from the left and sum up over m_d . We obtain

$$\begin{aligned}
 \sum_{k=1}^2 A_{ik}^d(p) \phi_k(p) &= \frac{1}{E_d - \frac{p^2}{m}} \int d^3 p' \sum_{j=1}^6 v_j^{00}(\mathbf{p}, \mathbf{p}') \\
 & \quad \sum_{k'=1}^2 B_{ijk'}^d(\mathbf{p}, \mathbf{p}') \phi_{k'}(p'), \quad (10)
 \end{aligned}$$

which is a set of two coupled equations for $\phi_k(p)$, with $A_{ik}^d(p)$ and $B_{ijk'}^d(\mathbf{p}, \mathbf{p}')$ being defined as

$$A_{ik}^d(p) \equiv \sum_{m_d=-1}^1 \langle 1m_d | b_i(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) b_k(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) |1m_d\rangle \quad (11)$$

$$B_{ijk'}^d(\mathbf{p}, \mathbf{p}') \equiv \sum_{m_d=-1}^1 \langle 1m_d | b_i(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}) w_j(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}, \mathbf{p}') b_{k'}(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}') |1m_d\rangle. \quad (12)$$

The functions $A_{ik}^d(p)$ and $B_{ijk'}^d(\mathbf{p}, \mathbf{p}')$ are scalar functions of the vectors \mathbf{p} and \mathbf{p}' , and need to be calculated only once. As example we have e.g.

$$\begin{aligned}
 A_{11}^d(p) &= 3 \\
 A_{22}^d(p) &= \frac{8}{3} p^4 \\
 B_{141}^d(\mathbf{p}, \mathbf{p}') &= (\mathbf{p} \times \mathbf{p}')^2 \\
 B_{151}^d(\mathbf{p}, \mathbf{p}') &= (\mathbf{p}' + \mathbf{p})^2 \\
 B_{161}^d(\mathbf{p}, \mathbf{p}') &= (\mathbf{p}' - \mathbf{p})^2. \quad (13)
 \end{aligned}$$

2.3 The NN scattering

The operator structure given in Eq. (1) for NN force can also be applied to the NN T-matrix as

$$T^{m_i}(\mathbf{p}', \mathbf{p}) = \sum_{j=1}^6 t_j^{m_i}(\mathbf{p}', \mathbf{p}) w_j(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}), \quad (14)$$

with $t_j^{m_i}(\mathbf{p}', \mathbf{p})$ being the scalar functions to be found. Inserting both the expansion in Eqs. (1) and (14) into the Lippmann-Schwinger equation,

$$\begin{aligned}
 T^{m_i}(\mathbf{p}', \mathbf{p}) &= V^{m_i}(\mathbf{p}', \mathbf{p}) \\
 &+ 2\mu \lim_{\epsilon \rightarrow 0} \int d\mathbf{p}'' \frac{V^{m_i}(\mathbf{p}', \mathbf{p}'') T^{m_i}(\mathbf{p}'', \mathbf{p})}{p^2 + i\epsilon - p''^2}, \quad (15)
 \end{aligned}$$

where μ is the reduced mass of the NN system, leads to

$$\begin{aligned}
 & \sum_{k=1}^6 t_k^{m_i}(\mathbf{p}', \mathbf{p}) w_k(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) \\
 &= \sum_{k=1}^6 v_k^{m_i}(\mathbf{p}', \mathbf{p}) w_k(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}) \\
 & \quad + 2\mu \lim_{\epsilon \rightarrow 0} \int d\mathbf{p}'' \frac{1}{p^2 + i\epsilon - p''^2} \\
 & \quad \sum_{j=1}^6 v_j^{m_i}(\mathbf{p}', \mathbf{p}'') w_j(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p}'') \\
 & \quad \sum_{k'=1}^6 t_{k'}^{m_i}(\mathbf{p}'', \mathbf{p}) w_{k'}(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}'', \mathbf{p}). \quad (16)
 \end{aligned}$$

We remove the spin dependence from Eq. (16) by multiplying from the left with $w_i(\boldsymbol{\sigma}_1, \boldsymbol{\sigma}_2, \mathbf{p}', \mathbf{p})$ and perform the trace. This leads to

$$\begin{aligned}
 & \sum_{k=1}^6 A_{ik}(\mathbf{p}', \mathbf{p}) t_k^{m_i}(\mathbf{p}', \mathbf{p}) \\
 &= \sum_{k=1}^6 A_{ik}(\mathbf{p}', \mathbf{p}) v_k^{m_i}(\mathbf{p}', \mathbf{p}) \\
 &+ 2\mu \lim_{\epsilon \rightarrow 0} \sum_{j,k'=1}^6 \int d\mathbf{p}'' \frac{1}{p^2 + i\epsilon - p''^2} \\
 & B_{ijk'}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) v_j^{m_i}(\mathbf{p}', \mathbf{p}'') t_{k'}^{m_i}(\mathbf{p}'', \mathbf{p}), \quad (17)
 \end{aligned}$$

where $A_{ik}(\mathbf{p}', \mathbf{p})$ and $B_{ijk'}(\mathbf{p}', \mathbf{p}'', \mathbf{p})$ are defined as

$$A_{ik}(\mathbf{p}', \mathbf{p}) \equiv \text{Tr}\{w_i(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) w_k(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p})\} \quad (18)$$

$$B_{ijk'}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) \equiv \text{Tr}\{w_i(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) w_j(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}'') w_{k'}(\sigma_1, \sigma_2, \mathbf{p}'', \mathbf{p})\} \quad (19)$$

Again the functions $A_{ik}(\mathbf{p}', \mathbf{p})$ and $B_{ijk'}(\mathbf{p}', \mathbf{p}'', \mathbf{p})$ are scalar functions of the momenta \mathbf{p} and \mathbf{p}' , and need to be evaluated only once. As example we show here,

$$\begin{aligned}
 A_{24}(\mathbf{p}', \mathbf{p}) &= A_{42}(\mathbf{p}', \mathbf{p}) = 4(\mathbf{p} \times \mathbf{p}')^2 \\
 A_{56}(\mathbf{p}', \mathbf{p}) &= A_{65}(\mathbf{p}', \mathbf{p}) = 4(p'^2 - p^2)^2 \\
 B_{122}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) &= B_{212}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) = B_{221}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) = 12 \\
 B_{124}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) &= B_{214}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) = 4(\mathbf{p} \times \mathbf{p}'')^2 \\
 B_{144}(\mathbf{p}', \mathbf{p}'', \mathbf{p}) &= 4(\mathbf{p}'' \times \mathbf{p}') \cdot (\mathbf{p} \times \mathbf{p}'')^2 \quad (20)
 \end{aligned}$$

Equation (17) is a set of six coupled equations for $t_k^{m_i}(\mathbf{p}', \mathbf{p})$, which can e.g. be solved as a system of linear equations.

The NN scattering observables can be calculated from the anti-symmetrized scattering amplitude $M_{m'_1 m'_2, m_1 m_2}^{m_i}(\mathbf{p}', \mathbf{p})$, which is defined as

$$\begin{aligned}
 & M_{m'_1 m'_2, m_1 m_2}^{m_i}(\mathbf{p}', \mathbf{p}) \\
 & \equiv \langle tm_t | \langle m'_1 m'_2 | \langle \mathbf{p}' | M(1 - P_{12}) | \mathbf{p} \rangle | m_1 m_2 \rangle | tm_t \rangle \quad (21)
 \end{aligned}$$

and can be parameterized by the Wolfenstein parameters $a^{m_i}(\mathbf{p}', \mathbf{p})$, $c^{m_i}(\mathbf{p}', \mathbf{p})$, $m^{m_i}(\mathbf{p}', \mathbf{p})$, $g^{m_i}(\mathbf{p}', \mathbf{p})$, $h^{m_i}(\mathbf{p}', \mathbf{p})$ as [6]

$$\begin{aligned}
 & M_{m'_1 m'_2, m_1 m_2}^{m_i}(\mathbf{p}', \mathbf{p}) \\
 &= a^{m_i}(\mathbf{p}', \mathbf{p}) \langle m'_1 m'_2 | w_1(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) | m_1 m_2 \rangle \\
 & - i \frac{c^{m_i}(\mathbf{p}', \mathbf{p})}{|\mathbf{p} \times \mathbf{p}'|} \langle m'_1 m'_2 | w_3(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) | m_1 m_2 \rangle \\
 & + \frac{m^{m_i}(\mathbf{p}', \mathbf{p})}{|\mathbf{p} \times \mathbf{p}'|^2} \langle m'_1 m'_2 | w_4(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) | m_1 m_2 \rangle \\
 & + \frac{g^{m_i}(\mathbf{p}', \mathbf{p}) + h^{m_i}(\mathbf{p}', \mathbf{p})}{(\mathbf{p} + \mathbf{p}')^2} \\
 & \quad \langle m'_1 m'_2 | w_5(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) | m_1 m_2 \rangle \\
 & + \frac{g^{m_i}(\mathbf{p}', \mathbf{p}) - h^{m_i}(\mathbf{p}', \mathbf{p})}{(\mathbf{p} - \mathbf{p}')^2} \\
 & \quad \langle m'_1 m'_2 | w_6(\sigma_1, \sigma_2, \mathbf{p}', \mathbf{p}) | m_1 m_2 \rangle. \quad (22)
 \end{aligned}$$

Thus, finally we connect the scattering amplitude or similarly the Wolfenstein parameters to the scalar function $t_j^{m_i}(\mathbf{p}', \mathbf{p})$. This can be accomplished by means of Eq. (22) and the relation between the M- and T-matrix given as

$$M = -\mu(2\pi)^2 T. \quad (23)$$

We obtain

$$\begin{aligned}
 a^{m_i} &= t_1 + (-)^t \left[\frac{1}{2} \tilde{t}_1 + \frac{3}{2} \tilde{t}_2 \right. \\
 & \quad \left. + \frac{1}{2} p^4 (1 - x^2) \tilde{t}_4 + p^2 (1 - x) \tilde{t}_5 + p^2 (1 + x) \tilde{t}_6 \right] \\
 c^{m_i} &= i p^2 \sqrt{1 - x^2} (t_3 - (-)^t \tilde{t}_3) \\
 m^{m_i} &= t_2 + p^4 (1 - x^2) t_4 + (-)^t \left[\frac{1}{2} \tilde{t}_1 - \frac{1}{2} \tilde{t}_2 \right. \\
 & \quad \left. + \frac{1}{2} p^4 (1 - x^2) \tilde{t}_4 - p^2 (1 - x) \tilde{t}_5 - p^2 (1 + x) \tilde{t}_6 \right] \\
 g^{m_i} &= t_2 + p^2 (1 + x) t_5 + p^2 (1 - x) t_6 \\
 & \quad + (-)^t \left[\frac{1}{2} \tilde{t}_1 - \frac{1}{2} \tilde{t}_2 - \frac{1}{2} p^4 (1 - x^2) \tilde{t}_4 \right] \\
 h^{m_i} &= p^2 (1 + x) t_5 - p^2 (1 - x) t_6 \\
 & \quad + (-)^t \left[-p^2 (1 - x) \tilde{t}_5 + p^2 (1 + x) \tilde{t}_6 \right], \quad (24)
 \end{aligned}$$

where $x = \hat{\mathbf{p}}' \cdot \hat{\mathbf{p}}$. Note that in Eq. (24) we drop \mathbf{p} and \mathbf{p}' for simplicity and apply the following notation,

$$\begin{aligned}
 t_j &\equiv t_j^{m_i}(\mathbf{p}', \mathbf{p}) \\
 \tilde{t}_j &\equiv t_j^{m_i}(\mathbf{p}', -\mathbf{p}). \quad (25)
 \end{aligned}$$

3 Summary

We propose a new technique to calculate the 2N system as function of momentum vectors, i.e. without employing a partial wave decomposition. The technique is useful especially in energy regions of hundreds of MeV or when considering the NN t-matrix as input to a three-body calculation. Based on scalar interactions, the scattering of three-bosons has been successfully carried out up to the GeV regime, formulating the Faddeev equations as functions of vector momenta [7]. The formulation of NN scattering presented here is an important step on the way of performing realistic three-body scattering calculations at higher energies.

Based on the general operator structure of the NN interaction we derive the formulation in a spin-momentum operator representation. Here the NN potential, the T-matrix, and the deuteron state are expanded in a set of scalar products of spin operators and momentum vectors. We derive a set of two coupled equations for the deuteron wave function components, which are connected to the standard partial wave projected wave function s- and d-wave in a simple manner. In case of the NN scattering we obtain a set of six coupled equations for the scalar functions defining the NN T-matrix, and therefore, the scattering amplitude in the Wolfenstein representation.
