Overview of LHCb results on beauty and charm spectroscopy

Antimo Palano¹,*

¹INFN and University of Bari, Italy, on behalf of the LHCb Collaboration

Abstract. We present a summary of new experimental results from LHCb experiment on the status of the charm spectroscopy using inclusive approaches and Dalitz plot analyses of $B$ and $B_s$ decays. We also summarize latest results on the spectroscopy of heavy baryons.

1 Introduction

The LHCb experiment [1] is collecting very large samples of $c\bar{c}$ and $b\bar{b}$ events. The present results are mostly based on data collected in 2011 and 2012 during the Run 1 period, corresponding to an integrated luminosity of $\approx 3.0 \text{ fb}^{-1}$.

2 Charm meson spectroscopy

Two methods are used for studying or discovering new states in LHCb.

• Inclusive approach: the study of inclusive final states $D^0\pi^+$, $D^+\pi^-$ and $D^{*+}\pi^-$ in the reactions

$pp \rightarrow D_JX,$

and of the final states $D^0K^+$, $D^+K_S^0$ and $D^{*+}K_S^0$ in the reactions

$pp \rightarrow D_{sJ}X.$

In these reactions,

– All resonances can be produced.
– The signal to background ratio can be poor.
– A spin-parity analysis of three-body decays can only distinguish between Natural and Unnatural Parity assignments.
– No spin analysis is possible for two-body decays.

• Exclusive approach: Dalitz plot analysis of $B$ and $B_s$ decays. In these cases,

– A full spin-parity analysis is possible.
– High mass resonances can have low rates or may not be produced.
– The analysis can be complicated by the presence of multiple interfering contributions.

2.1 Observation of new $D_J$ mesons

The LHCb experiment has performed an inclusive study of the $D\pi$ and $D^*\pi$ systems using 1 fb$^{-1}$ of data [2]. In the study of the $D^{*+}\pi^−$ system, with $D^{*+} \rightarrow D^0\pi^+$, the data are separated in terms of the $\pi^−$ helicity angle $\theta_H$. The sample with $|\cos\theta_H|>0.75$ is defined as “Enhanced Unnatural Parity Sample”, while the sample with $|\cos\theta_H|<0.5$ is defined as “Natural Parity Sample”. The two mass spectra are shown in Fig. 1. In the Enhanced Unnatural Parity sample, above the $D_1(2420)$ and $D_2^*(2460)$, three new structures are observed: $DJ(2550)^0$, $DJ(2760)^0$ and $DJ(3000)^0$. In the Natural Parity sample, two further structures are observed: $D_J(2600)^0$ and $D_J(2760)^0$. The presence of these two Natural Parity states is confirmed by the analysis of the $D^+\pi^−$ and $D^0\pi^+$ data.

2.2 First observation and Dalitz plot analysis of $B^− \rightarrow D^+K^−\pi^−$

The $D^+K^−\pi^−$ mass spectrum [3] is shown in Fig. 2 (Left) and contains $\approx2000$ events in the $B^−$ signal region. A standard Dalitz plot analysis of the $B^− \rightarrow D^+K^−\pi^−$ system has been performed. The best fit is obtained introducing virtual $D_0^s(2007)^0$, $B_s^0$ and nonresonant contributions. A clear spin-2 $D_2^*(2460)$ signal and a $D_J(2760)^0$ spin-1 resonance are also observed. The $D^+\pi^−$ fit projection with fit result is shown in Fig. 2(Right). No evidence for a $D_J^*(2760)^0$ spin-3 resonance is found in this final state.
2.3 Dalitz plot analysis of $B^0 \to \bar{D}^0 \pi^+ \pi^-$

The $B^0 \to \bar{D}^0 \pi^+ \pi^-$ [4] signal contains $\approx 9600$ events with 97.8% purity. The $B^0 \to \bar{D}^0 \pi^+ \pi^-$ Dalitz plot is shown in Fig. 3 (Left). The spin-2 $D_s^*(2460)$ signal along the $D^0 \pi^-$ axis and the spin-1 $\rho(770)$ signal along the $\pi^+ \pi^-$ axis are observed. The Dalitz plot analysis has been performed using the isobar model and a K-matrix description of the $\pi^+ \pi^-$ S-wave. Both methods give a good description of the data. The $m^2(\bar{D}^0 \pi^-)$ fit projection is shown in Fig. 3 (Center),(Right). The decay is dominated, in the $\pi^+ \pi^-$ system, by S-wave $(16.51 \pm 0.70 \pm 1.68 \pm 1.10)\%$ and $\rho(770) (36.13 \pm 1.00 \pm 2.13 \pm 0.79)\%$. In the $D^0 \pi^-$ system, the largest contribution comes from the $D_s^*(2460)^-$ resonance $(28.13 \pm 0.72 \pm 1.06 \pm 0.54)\%$.

The Dalitz plot analysis requires the presence of an additional $J^P = 3^-$ resonance with a K-matrix model fitted fraction of $(1.58 \pm 0.22 \pm 0.18 \pm 0.07)\%$.

2.4 Dalitz plot analysis of $B^0 \to \bar{D}^0 K^+ \pi^-$

The $B^0 \to \bar{D}^0 K^+ \pi^-$ [5] signal region contains $\approx 2300$ events. The $B^0$ Dalitz plot is shown in Fig. 4(Left). The fit projections are shown in Fig. 4(Center),(Right). The decay is dominated by intermediate resonance production of $K^*(892)^0 (37.4 \pm 1.5)\%, D_s^0(2400)^- (19.3 \pm 2.8)\%$ and $D_s^*(2460)^- (23.1 \pm 1.2)\%$. These Dalitz analyses obtain new parameters for the broad $D_s^*(2400)$ resonance which are summarized in Table 1. No evidence is found for additional spin-1 or spin-3 $D_s^*$ resonances.

3 Results on $D_{sJ}$ mesons spectroscopy

3.1 Dalitz plot analysis of $B^0_s \to \bar{D}^0 K^- \pi^+$

Figure 5(Left) shows the $\bar{D}^0 K^- \pi^+$ mass spectrum [8]. The $B^0_s$ signal contains $\approx 11000$ signal events. The Dalitz analysis shows that the largest components are: $K^*(892)^0 (28.6)\%, D_s^{*+}(2573)^- (25.7)\%$, and
Table 1. $D^*_J(2400)$ resonances parameters from the different Dalitz analyses.

Figure 5. (Left) $\bar{D}^0 K^-\pi^+$ mass spectrum. (Right) $K^-\pi^+$ and $\bar{D}^0 K^-$ mass projections.

Resonances $D^*_1(2710)^+$ and $D^*_3(2860)^+$ have been observed with parameters consistent with those from previous measurements \cite{6}.

Figure 6. $D^*+K^0_S$ with enhanced Natural Parity mass spectrum.

$K\pi$ S-wave (LASS) (21.4 \%) $\bar{D}^0 K^-$ nonresonant (12.4 \%). A signal present in the 2860 MeV $\bar{D}^0 K^-$ mass region which is described by a superposition of a new spin-1 (5.0 ± 1.2 ± 0.7 ± 3.3 \%) and a spin-3 (2.2 ± 0.1 ± 0.3 ± 0.4 \%) resonances. The fitted resonances parameters are:

- $m(D^*_1(2860)^-) = 2859 ± 12 ± 6 ± 23$ MeV, $\Gamma(D^*_1(2860)^-) = 159 ± 23 ± 27 ± 72$ MeV,
- $m(D^*_3(2860)^-) = 2860.5 ± 2.6 ± 2.5 ± 6.0$ MeV, $\Gamma(D^*_3(2860)^-) = 53 ± 7 ± 4 ± 6$ MeV.

3.2 Inclusive studies

Using samples of $0.36 \times 10^6 D^+K^0_S$ and $3.15 \times 10^6 D^0K^+$ inclusive candidates \cite{6}, the $D^*_1(2710)^+$ and $D^*_3(2860)^+$ have been observed with parameters consistent with previous measurements \cite{7}.

The inclusive $D^+K^0_S$ mass spectrum with enhanced Natural Parity selection is shown in Fig. 6 \cite{9}. Resonances $D^*_1(2710)^+$ and $D^*_3(2860)^+$ are observed with parameters consistent with those from
inclusive and exclusive analyses. Significances are 7.6σ and 7.1σ respectively. A search has been performed for the new spin-1 resonance \( D_{s1}^{*}(2860)^{+} \) observed in the \( B_s \) decay. However, the same \( \chi^2/ndf \) is obtained in fit that excludes it and its resulting statistical significance is 3.3σ. It is concluded that the data are not sensitive to the presence of the \( D_{s1}^{*}(2860)^{+} \) resonance.

Figure 7 (Left) shows the threshold region of the \( D^{*}K_S^{0} \) mass spectrum with enhanced Natural Parity selection. Signals of \( D_{s1}(2536)^{+} \) and \( D_{s2}(2573)^{+} \) are observed. \( D_{s2}(2573)^{+} \) is observed here for the first time and has a significance of 6.9σ. Its mass is found to be consistent with that obtained from the \( D_{s1}(2536)^{+} \) measurements. The \( D_{s2}(2573)^{+} \) angular distribution is shown in Fig. 7 (Right) and is consistent with a \( JP = 2^+ \) Natural Parity assignment. The relative branching fraction of the decay \( D_{s2}(2573)^{+} \rightarrow D^{*}K_S^{0} \) is measured as

\[
\frac{\mathcal{B}(D_{s2}(2573)^{+} \rightarrow D^{*}K_S^{0})}{\mathcal{B}(D_{s2}(2573)^{+} \rightarrow D^{+}K_S^{0})} = 0.044 \pm 0.005 \text{ (stat)} \pm 0.011 \text{ (syst).} \tag{1}
\]

and is in agreement with expectations from quark model calculations which predict a value of 0.058 for this ratio [10].

4 Search for new \( B^{**} \) states

The search for new \( B^{**} \) states is based on 3 fb\(^{-1} \) of data [11]. High purity \( B^{+} \) (2.5 \times 10^6) and \( B^{0} \) (1.2 \times 10^6) samples are selected through:

\[ B^{-} \rightarrow J/\psi K^{-}, \ B^{-0} \rightarrow D^{0} \rightarrow K^{-} \pi^{+}(\pi^{+} \pi^{-}) \ [\text{with} \ D^{0} \rightarrow K^{-} \pi^{+}(\pi^{-} \pi^{+})], \ B^{0} \rightarrow J/\psi K^{*}(892)^{0}. \]

Figure 8 shows the \( \delta m \) distributions for \( B^{+} \pi^{-} \) and \( B^{0} \pi^{+} \) systems. The narrow states are identified as \( B_{1}(5721)^{0, +} \) and \( B_{2}^{*}(5747)^{0, +} \). New broad states are observed and labelled as \( B_{J}(5840) \) and \( B_{J}(5960) \).

5 New results on baryon spectroscopy

5.1 Observation of excited \( \Lambda_{b}^{0} \) states

The quark model predicts orbitally excited \( \Lambda_{b}^{0} \) with \( JP = \frac{1}{2}^{+} \) and \( JP = \frac{3}{2}^{+} \) decaying to \( \Lambda_{b}^{0} \pi^{+} \pi^{-} \) or \( \Lambda_{b}^{0} \gamma \). A clean sample of 70,500 \( \Lambda_{b} \rightarrow \Lambda_{c} \pi \) decays in 1.0 fb\(^{-1} \) of data is reconstructed, with \( \Lambda_{c} \rightarrow pK^{-} \pi^{+} \). The \( \Lambda_{b}^{+} \pi^{-} \) is shown in Fig. 9 [12]. Two narrow states observed with the following parameters
Figure 8. $\delta m$ distribution for (Left) $B^+\pi^-$ and (Right) $B^0\pi^+$ systems.

Figure 9. $\Lambda_b\pi^+\pi^-$ mass spectrum.

$$M_{\Lambda^0_b(5912)} = 5911.97 \pm 0.12 \pm 0.66 \text{ MeV}, \Gamma_{\Lambda^0_b(5912)} < 0.66 \text{ MeV (90\% CL)},$$

$$M_{\Lambda^0_b(5920)} = 5919.77 \pm 0.08 \pm 0.66 \text{ MeV}, \Gamma_{\Lambda^0_b(5920)} < 0.63 \text{ MeV (90\% CL)}.$$

The $\Lambda^0_b(5912)$ signal contains $17.6 \pm 4.8$ events and has a significance of $5.2\sigma$; the $\Lambda^0_b(5920)$ signal contains $52.5 \pm 8.1$ events with a significance of $10.2\sigma$.

5.2 $\Xi^0_b$ Spectroscopy

In 2012, the CMS collaboration [13] observed a new $\Xi^*_{b0} \rightarrow \Xi^- b \pi^+$ state [13]. LHCb has searched for this resonance using $\Xi^- \rightarrow \Xi^0_{b0} \pi^+$ and $\Xi^0_{c0} \rightarrow pK^-K^-\pi^+$ [14].

Figure 10 shows the $\delta m = m_{\text{cand}}(\Xi^- b \pi^+) - m_{\text{cand}}(\Xi^- b) - m(\pi^+)$ distribution, where a clean $\Xi^- \rightarrow \Xi^- b \pi^+$ is observed, confirming the CMS observation.

The resonance parameters are

$$m(\Xi^0_{b0}) - m(\Xi^- b) - m(\pi^+) = 15.727 \pm 0.068 \pm 0.023 \text{ MeV}, \Gamma(\Xi^0_{b0}) = 0.90 \pm 0.16 \pm 0.08 \text{ MeV}.$$

The state is consistent with being the $J^P = 3/2^-$ $\Xi^0_{b0}$ resonance expected in the quark model.

5.3 Observation of two new $\Xi^-_b$ resonances

LHCb experiment has searched for new states in the $\Xi^-_{b0}\pi^-$ mass spectrum, with $\Xi^-_{b0} \rightarrow \Xi^+_b \pi^-$ and $\Xi^-_c \rightarrow pK^-\pi^+$. Figure 11 shows the $\delta m = m_{\text{cand}}(\Xi^-_{b0}\pi^-) - m_{\text{cand}}(\Xi^-_{b0}) - m(\pi^-)$ distribution where two new states are observed [15].
The two states are consistent with being the $J^P = 1/2^+ \Xi_b^-$ and $J^P = 3/2^+ \Xi_b^{*-}$ resonances expected from the quark model in this mass region. Their parameters are measured to be

\[ m(\Xi_b^-) = 5935.02 \pm 0.02 \pm 0.01 \pm 0.50 \text{ MeV}, \Gamma(\Xi_b^-) < 0.08 \text{ MeV at 95% C.L.}, \]
\[ m(\Xi_b^{*-}) = 5955.33 \pm 0.12 \pm 0.06 \pm 0.50 \text{ MeV}, \Gamma(\Xi_b^{*-}) = 1.65 \pm 0.31 \pm 0.10 \text{ MeV}. \]

### 5.4 Search for $\Xi_{cc}^+$ states

LHCb experiment has performed an initial search for $\Xi_{cc}^+ \rightarrow \Lambda_c K^- \pi^+$ [16] using a small data set (0.65 $fb^{-1}$). No signal has been found. A more accurate search will be performed using the very high statistics data samples actually available.
6 Summary

- Several new $D_J$ and $D_{sJ}$ mesons have been observed in both inclusive and exclusive $B/B_s$ decays.
- The observation of these states in $B/B_s$ decays allows the determination of their quantum numbers.
- New high statistics data will be shortly available and new decay channels are being analyzed. These studies will allow to better understand the charm and strange-charm spectrum.
- Progress have been performed in completing the quark model spectrum for heavy baryons. Several new states have been discovered. Large progress are expected in the new future in understanding the heavy baryons using high statistics and high purity new decay channels.
