2. and Conclusion

The first test experiments with a pulsating heat pipe with water were carried out. It is established that pulsations begin when the tube is heated. In the future, it is planned to use sapphire tubes to determine the water temperature

The conclusion of the article should be replaced by the following text:

The experiments with a drop impact on the thin heated constantan foil with fluoropolymer coating were carried out. It is demonstrated that diameter of the drop after impact is increasing due to dynamics of the drop and then decreasing due to evaporation effect.
